

## Weebly Vs. Bootstrap

Property	Weebly	Bootstrap	Comment
High skill requirement	3	8	Weebly doesn't really require you to have any coding skills. You can simply just drag and drop with the easy-to-use User Interface. For bootstrap, you must know the html language and be familiar with the code
Ability for others to modify the page	10	3	In Weebly, you can make an admin list of people who can update the page right on the website, which is simple to do. For Bootstrap, you can't have them update if the files are located on your server.
Ability to implement transaction support (payments, etc)	10	2	There is an option to link paypal and other payment options to your account on Weebly. I'm not sure about Bootstrap, I imagine you need a bunch of security code and plug-ins.
Cost Efficient	10	7	You can make a Weebly website in a couple hours, while Bootstrap can take days just to get the code working right.
Mobile Friendly	10	9	I give Weebly a 10 because it automatically builds the website for mobile-compatibility. You can also view the screen as if you were looking at a phone screen as you're editing the page. I give bootstrap a 9 because it is very mobile-compatible, but not as easy to implement as Weebly.
Ability to be dynamic	10	10	You can implement .php files and other types of files, like we did for the _crud with a simple <iframe>
The ability to implement a store (not the same as payment process)	10	4	Weebly has a separate store management section where you can deal with taxes, shipping, customer information, and the option for a shopping cart. For Bootstrap, this would be very hard to implement without hours of research and work.
Outside resources to refer to for help	7	9	For Weebly, there are a lot of videos and tutorials how to get started. For Bootstrap, there is a ton of websites dedicated to Bootstrap, as well as how-to videos.
Ability to start with a template	10	10	Both of these options have tons of very beautiful templates that you can download or choose from, instead of starting from scratch.
Variety of different Elements/Classes/Objects to choose from	10	9	Weebly has pretty much everything that you can do with Bootstrap implemented in their UI. Bootstrap Has hundreds of different

			classes and objects that you can add to your page with ease, but it takes a little more time to perfect it rather than drag and drop.
